Highlights Postflexion larvae or young juveniles of euryhaline species are imported into the mangrove. Yolked and preflexion larvae of resident species are exported out of the mangrove. Larval advection is tidal and modulated by salinity, turbidity and zooplankton food. The larval assemblage in the mangrove reflects little of the existing fish fauna. Most fish species enter the mangrove as ...

commercial fish species spend part of their lifecycle in mangroves. Mangroves have been used for centuries by indigenous peoples for wood, thatch, medicines, dyes, and fish and shellfish. Mangrove forests are also among the major carbon sinks of the tropics (Cahoon et al. 2003, Bouillon et al. 2008, Nellemann et al. 2009) (Figure 3).

There are many kinds of animals that live in the mangrove habitat. Here's a picture guide that takes you around the life in the mangroves. On land, the mangrove roots shelter birds and many swamp animals, the branches are home to nesting birds. And below the water, there is a world rich in marine life, big and small, from crabs and shrimp to algae, to manatees, stingrays and nurse sharks.
