A circuit breaker in series before the parallel branches can prevent overloads by automatically opening the circuit. A 15 A circuit operating at 120 V consumes 1,800 W of total power. $P = VI = (120 \text{ V})(15 \text{ A}) = 1,800 \text{ W}$. Total power in a parallel circuit is the sum of the power consumed on the individual branches.

Then the complex combinational resistive network above comprising of ten individual resistors connected together in series and parallel combinations can be replaced with just one single equivalent resistance (R_{EQ}) of value 10Ω . When solving any combinational resistor circuit that is made up of resistors in series and parallel branches, the first step we need to take is to identify the ...

Resistors in Series and Parallel Resistor Combinations

Transform a combination circuit into a strictly series circuit by replacing (in your mind) the parallel section with a single resistor having a resistance value equal to the equivalent resistance of the parallel section. Use the Ohm's law equation ($\Delta V = I \cdot R$) often and appropriately. Most answers will be determined using this equation.
